Installation

To provision infrastructure on AWS using terraform, you need to have awscli configured, let's do that first.

1) MacOS and Linux users can install awscli from the below link

http://docs.aws.amazon.com/cli/latest/userguide/cli-install-macos.html

2) Also set the Path in your profile

export PATH=$PATH:/PATH/OF/AWS

3) Configure your aws profile by running

aws configure

It will asm for secret_key, access_key, region and output_format

4) Now let's install terraform

https://www.terraform.io/downloads.html

From the above link download terraform package according to your OS

5) Set path in your profile

export PATH=$PATH:/PATH/OF/Terraform

6) Run terraform version to verify

terraform --version
